WHAT IS HEART FAILURE?

Heart failure means that your heart muscle doesn’t pump as much blood as your body needs. Failure doesn’t mean that your heart has stopped. It means that your heart is not pumping as well as it should.

Because your heart cannot pump well, your body tries to make up for it. To do this:

- Your body holds on to salt and water. This increases the amount of blood in your bloodstream.
- Your heart beats faster.
- Your heart gets bigger.

Your body has an amazing ability to make up for heart failure. It may do such a good job that you don’t know you have a disease. But at some point, your heart and body will no longer be able to keep up. Then fluid starts to build up in your body, and you have symptoms like feeling weak and out of breath.

This fluid buildup is called congestion. It’s why some doctors call the disease congestive heart failure.

Heart failure usually gets worse over time. But treatment can slow the disease and help you feel better and live longer.

What Causes Heart Failure?

Anything that damages your heart or affects how well it pumps can lead to heart failure. Common causes of heart failure are:

- High blood pressure.
- Heart attack.
- Coronary artery disease.

Other conditions that can lead to heart failure include:

- Diabetes.
- Diseases of the heart muscle (cardiomyopathies).
- Heart valve disease.
- Disease of the sac around the heart (pericardial disease), such as pericarditis.
- A slow, fast, or uneven heart rhythm (arrhythmia).
- A heart problem that you were born with (congenital heart defect).
- Long-term alcohol abuse, which can damage your heart.
What are the Symptoms?
Symptoms of heart failure start to happen when your heart cannot pump enough blood to the rest of your body. In the early stages, you may:

- **Feel tired** easily.
- **Be short of breath** when you exert yourself.
- **Feel like your heart is pounding or racing** (palpitations).
- **Feel weak** or dizzy.

As heart failure gets worse, fluid starts to build up in your lungs and other parts of your body. This may cause you to:

- **Feel short of breath** even at rest.
- **Have swelling** (edema), especially in your legs, ankles, and feet.
- **Gain weight**. This may happen over just a day or two, or more slowly.
- **Cough or wheeze**, especially when you lie down.
- **Need to urinate** more at night.
- **Feel bloated** or sick to your stomach.

If your symptoms suddenly get worse, you will need emergency care.

HOW IS HEART FAILURE DIAGNOSED?
Your doctor may diagnose heart failure based on your symptoms and a physical exam. But you will need tests to find the cause and type of heart failure so that you can get the right treatment. These tests may include:

- Blood tests.
- A chest X-ray.
- An electrocardiogram (EKG or ECG) to check your heart’s electrical system.
- An echocardiogram to see the size and shape of your heart and how well it is pumping.
- Cardiac catheterization to check your heart and its blood vessels (coronary arteries).
- A stress test to look for coronary artery disease.

**Echocardiogram**
An echocardiogram is the best and simplest way to find out if you have heart failure, what type it is, and what is causing it. Your doctor can also use it to see if your heart failure is getting worse.

This test can measure how much blood your heart pumps to your body. This measurement is called the ejection fraction. If your ejection fraction gets lower and you are having more symptoms, it means that your heart failure is getting worse.

HOW IS IT TREATED?
Most people with heart failure need to take several medicines. Your doctor may prescribe medicines to:

- **Help keep heart failure from getting worse**. These drugs include ACE inhibitors, angiotensin II receptor blockers (ARBs), beta-blockers, and vasodilators like hydralazine and a nitrate.
- **Reduce symptoms** so you feel better. These drugs include diuretics (water pills), digoxin, and potassium.
- **Treat the cause** of your heart failure.

It is very important to take your medicines exactly as your doctor tells you to. If you don’t, your heart failure could get worse.

**Pacemaker or Defibrillator**
You might need to have a pacemaker or a defibrillator (ICD) if you have a problem with your heart rhythm. A pacemaker can help your heart pump blood better. An ICD can prevent a dangerous heart-rhythm problem.

CARE AT HOME
Lifestyle changes are an important part of treatment. They can help slow down heart failure. They may also help control other diseases that make heart failure worse, such as high blood pressure, diabetes, and coronary artery disease.

The best steps you can take are to:

- **Eat less sodium**. Sodium causes your body to retain water and makes it harder for your heart to pump. Your doctor may also ask you to limit how much fluid you drink.
- **Get regular exercise**. Your doctor can tell you what level of exercise is safe for you, how to check your pulse, and how to know if you are doing too much.
- **Take rest breaks** during the day.
- **Lose weight** if you are overweight. Even a few pounds can make a difference.
- **Stop smoking**. Smoking damages your heart and makes exercise harder to do.
• Limit alcohol. Ask your doctor how much, if any, is safe.

Ask your doctor if cardiac rehab is right for you. Rehab can give you education and support that help you learn self-care and build new healthy habits, such as exercise and healthy eating.

To stay as healthy as possible, work closely with your doctor. Have all your tests, and go to all your appointments. It is also important to:
  • Talk to your doctor before you take any new medicine, including nonprescription and prescription drugs, vitamins, and herbs. Some of them may make your heart failure worse.
  • Keep track of your symptoms. Weigh yourself at the same time every day, and write down your weight. Call your doctor if you have a sudden weight gain, a change in your ability to exercise, or any sudden change in your symptoms.

WHAT CAN YOU EXPECT IF YOU HAVE HEART FAILURE?

Medicines and lifestyle changes can slow or even reverse heart failure for some people. But heart failure often gets worse over time.

Early on, your symptoms may not be too bad. As heart failure gets worse, you may need to limit your activities. Treatment can often help reduce symptoms, but it usually doesn’t get rid of them.

Heart failure can also lead to other health problems. These may include:
  • Trouble with your heart rhythm (arrhythmia).
  • Stroke.
  • Heart attack.
  • Mitral valve regurgitation.
  • Blood clots in your legs (deep vein thrombosis) or lungs (pulmonary embolism).

Your doctor may be able to give you medicine or other treatment to prevent or treat these problems.

Heart failure can get worse suddenly. If this happens, you will need emergency care. To prevent sudden heart failure, you need to avoid things that can trigger it. These include eating too much salt, missing a dose of your medicine, and exercising too hard.

Knowing that your health may get worse can be hard. It is normal to sometimes feel sad or hopeless. But if these feelings last, talk to your doctor. Antidepressant medicines, counseling, or both may help you cope.

HEALTH CLICKS

MVP Health Care® has online resources to help you take charge of your health, available 24 hours a day at www.mvphealthcare.com!

Make informed decisions about your health by using the Healthwise® Knowledgebase—our online Health Encyclopedia. Curious about the medications you take every day? Visit www.mvphealthcare.com and select Members, then Live Healthy, and then Health Encyclopedia A-Z—your one-stop resource for the latest health information.

Calculate the risks and benefits of your health habits with our Health Tools & Calculators. If you think you are ready to make a change in your health habits, or are looking for resources to explore healthy ideas that may be right for you, click on any of our interactive health tools and calculators for quick, personalized results. Visit www.mvphealthcare.com and select Members, then Live Healthy, and then Health Tools and Calculators!

Enjoy Exclusive Member Discounts

As an MVP member, you can enjoy savings on a wide range of health and wellness products and services that can help you live well through our partnership with the ChooseHealthy™ Discount Network. Go to www.mvphealthcare.com and select Members, then Live Healthy, and then ChooseHealthy Discounts for more information on:
  • Access to participating providers who offer a 25 percent discount on Chiropractic and Acupuncture Care, Massage Therapy or Dietetic Counseling.
  • More than 15,000 fitness clubs and exercise centers at which you can get “best pricing” and a free trial offer.

Quick Tips for Being Prepared to Talk to Your Doctor

Patients who have good relationships with their doctors are more satisfied with their care and have better results. Here are some tips to help you and your doctor become better partners in improving your health care:

• Write down your questions before your visit. List the most important ones first to make sure they get asked and answered.

• Bring a “health history” list with you, and keep it up-to-date.

• Always bring any medications you are taking, including over-the-counter, or a list of those medications (include when and how often you take them) and what strength.

• You might want to bring someone along to help you ask questions and remember the answers.

• Find more information and printable forms at www.mvphealthcare.com.
